## Preparing the artwork dimensions for production

Lanyard size

Full-color lanyards use a special heat sublimation method to transfer a digitally printed design in CMYK colors from a transfer paper to the lanyard. During the transfer process, small variations will happen in positioning that may cause the transferred image to move up to a 1/25" sideways. For that reason, the artwork has "bleeds." The design for a 3/4" lanyard must be 1" in height. Please ensure that any background color or pattern fills this entire area.

## Color variation and Pantone® colors

If Pantone colors are specified in the artwork or digital proof, they are used only as a guideline for the final product. Perfect Pantone matching is impossible due to the technical limitations of full-color CMYK printing. Computer screens are not optimal for color specification, and there are always differences between each screen. Therefore, the computer screen should not be used as a reference for determining any colors used for the final product.

## The reverse side is not aligned by default

The printing of the reverse side is not position-matched. The logos will not meet on the two sides of the lanyard. Create a one-color reverse side or a pattern where the two sides don't need to align.

Two-sided matching is available for an additional surcharge.

You must acknowledge that a lanyard without a safety break poses a choking hazard and, therefore, is not approved by the CPSC (Consumer Product Safety Commission) as safe for children or adults to wear unless the lanyard includes a safety break.
